

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol indicates that port 53 is unreachable when attempting to access the Yummy Recipes for Me website. Port 53 is usually used for standard DNS queries. This may indicate either a DNS connectivity problem. It is possible that the DNS server is down or unresponsive; firewall or network security rules blocking port 53 (UDP/TCP); incorrect DNS server configuration on the device or router; or ISP DNS issues or network connectivity problems.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

The incident occurred when several customers of clients reported that they could not access the client company website. The network security team responded and began running tests with the network protocol analyzer tool tcpdump. The resulting logs revealed that port 53, which is used for standard DNS queries, is not reachable. Continued investigations of the root cause are underway to determine how access to the secure web portal can be restored. The next steps include examining the firewall configuration to see if port 53 is blocked and contacting the system administrator for the web server to have them check the system for signs of an attack.
